Key Business Challenges – As business matures, companies require enterprise-scalable functionality for their corporate environments. To support the expansion of their computing boundaries, businesses have embraced application and database servers.

These servers support servlets, Java Server Pages, and Enterprise JavaBeans technologies, providing simplified development and flexible deployment of Web-based applications.

However, securing this malleable model presents a challenge. Successful companies recognize that their security infrastructures need to address the business challenge. Most of them are not aware of the types of attacks that malevolent entities can launch against their servers and can plan appropriate defenses both internally and externally.

Following are the components that will be part of this services:

- Execute a planning session with client's IT team to gather initial data on the installed systems.
- Collect all the necessary snapshots in a separate JFS2 filesystem.
- Record changes after executing different AIX tools and commands

- Securing the Base Operating System and provide high level information about how to protect the system.
- Understand, explore and recommend customers common security setup including authentication, authorization, confidentiality, privacy, integrity, and availability by considering AIX best practices methodologies.
- A set of AIX systems security related utilities will be used to explore customers' existing environment that helps in identifying and reducing security hazards.
- Present summary to client's senior executive management with suggestions and recommendations.
- You will be informed for taking necessary actions to implement TLC findings and recommendations that includes the installation of AIX fixes related AIX securities.
- Provide up to two of your personnel with basic skills instruction on the administrative tasks performed during this services .
